Livestock Report of the State Department of Revenue

1975-1976

FOREWORD

The principal reason that the information contained in this report is being published separately being integrated into the "Report of the State Department of Revenue" lies in the change in of assessing livestock which was made between 1975 and 1976. It was felt that incorporation of to the "Report" would tend to confuse the data series and that it was, therefore, better to eparate publication so that the reason for differences between the data for 1975 (and prior 1976 could be pointed out.

ison of the livestock data for 1975 with that of 1976 indicates a substantial decrease in umbers and a corresponding decrease in total assessed and total taxable values. These can be, in large measure, explained on the basis of census and classification procedure ther than livestock decreases.

the livestock census was based on the total stock on hand as of March 1. The 1975 Legislative cted a bill which required that livestock census be based on an average inventory with census n on the last day of each month. In addition, the new law (Section 84-202(5) (c), R.C.M. 1947, ion Laws of 1975, Chapter 442) exempted "livestock defined as cattle, sheep, horses or mules not attained the age of 9 months as of the last day of any month". Implementation of that legis- ounded with new classification and age groupings for all livestock. The result can be seen by the reports of 1975 and 1976.

ie effects of the classification changes and the exemption of young livestock are taken into e livestock totals for the two years are comparable. Thus, even though there is a significant n 1975 to 1976, it is largely explained by changes in the law governing assessment practices by real decline in livestock numbers.

paring the totals for the two years presented in this report with those appearing in the "Report of Department of Revenue" some disparities will be noted. The data in this report has been accuracy and, thus, is to be preferred. The number of animals in each category found in the the State Department of Revenue" was derived from raw data submitted by each county he validity of this data was not checked by an independent process prior to publication of the nd, to that extent, the data in this livestock report should be considered as the final revision of ata. The same statements can be made about assessed and taxable values although these have ed to a lesser degree.

The Montana Livestock Report of the State Department of Revenue is intended to supplement the Report of the State Department of Revenue published in December 1976. The two reports cover the same period of time. The supplement was necessitated by the format change in the Report of the State Department of Revenue which eliminated the livestock data series.

FOREWORD

The principal reason that the information contained in this report is being published separately rather than being integrated into the "Report of the State Department of Revenue" lies in the change in the method of assessing livestock which was made between 1975 and 1976. It was felt that incorporation of this data into the "Report" would tend to confuse the data series and that it was, therefore, better to attempt a separate publication so that the reason for differences between the data for 1975 (and prior years) and 1976 could be pointed out.

Comparison of the livestock data for 1975 with that of 1976 indicates a substantial decrease in livestock numbers and a corresponding decrease in total assessed and total taxable values. These decreases can be, in large measure, explained on the basis of census and classification procedure changes rather than livestock decreases.

In 1975 the livestock census was based on the total stock on hand as of March 1. The 1975 Legislative Session enacted a bill which required that livestock census be based on an average inventory with census counts taken on the last day of each month. In addition, the new law (Section 84-202(5) (c), R.C.M. 1947, and in Session Laws of 1975, Chapter 442) exempted "livestock defined as cattle, sheep, horses or mules which have not attained the age of 9 months as of the last day of any month". Implementation of that legislation was coupled with new classification and age groupings for all livestock. The result can be seen by comparing the reports of 1975 and 1976.

After the effects of the classification changes and the exemption of young livestock are taken into account, the livestock totals for the two years are comparable. Thus, even though there is a significant decline from 1975 to 1976, it is largely explained by changes in the law governing assessment practices rather than by real decline in livestock numbers.

In comparing the totals for the two years presented in this report with those appearing in the "Report of the State Department of Revenue" some disparities will be noted. The data in this report has been verified for accuracy and, thus, is to be preferred. The number of animals in each category found in the "Report of the State Department of Revenue" was derived from raw data submitted by each county assessor. The validity of this data was not checked by an independent process prior to publication of the "Report" and, to that extent, the data in this livestock report should be considered as the final revision of livestock data. The same statements can be made about assessed and taxable values although these have been affected to a lesser degree.
